

# MCR10028

## Fix spurious characters in PL/1 sources

Eric Swenson

January 19, 2017

### 1 Issue

This MCR addresses ticket:

<https://sourceforge.net/p/dps8m/tickets/116/>

Three sources files:

- basic\_system.pl1
- process\_cobol\_report.pl1
- g115\_protocol\_.pl1

have a spurious `\015` character at the end of of the file. This prevents successful compilation by the PL/1 compiler.

These `\015` characters presumably crept into these files when they were transferred from the ACTC/MIT tape to Multics. The tools used to transfer these files had various issues over their lifetimes, including the addition of spurious characters.

### 2 Proposed Change

The proposed change is to remove these `\015` characters, recompile, and rebind these components.
